

Bảo:

UI generated by v0.app:

Now, I want to design these use-cases for my website (for Admin). Create 3 tabs: Manage music; Manage reports; Manage premium with the use-cases below. And remember to design the UI in dark mode, with black and purple being the 2 main colors (can adding other dark colors if necessary).

1. Use-case Manage music catalog:

Design UI for this use-case:

- Name: Manage music catalog
- This use-case describes how admins can add, remove, and modify songs and playlists of songs.
- The basic flow in this use-case:
 1. *Admin selects Manage music catalog section.*
 2. *Admin can see 2 sections: Songs and Playlists, choose one section to view all songs/playlists.*
 3. *Manage songs*
 - Remove a song:
 - + Admin selects a song to view options
 - + Then, admin chooses Delete song.
 - + Then, the system deletes the song from the platform.
 - Add a song:
 - + Admin selects Add song to add song's audio file, its avatar picture and its metadata (name, author's name, composer's name, genre, published year, lyrics, etc).
 - + If the song already exists, it goes to the *Existed song* alternative flow mentioned below, or else the system will receive the data and create the song according to those data.
 - Modify a song:
 - + Admin selects a song to view options.
 - + Admin then chooses Modify song to modify its metadata, or to change its avatar picture.
 - + The system updates the song.
 4. *Manage playlists*
 - Remove a playlist:
 - + Admin selects a playlist to view options.
 - + Admin then chooses Delete playlist.
 - + The system deletes the playlist.
 - Add a playlist:
 - + Admin selects Add playlist to create a new playlist.
 - + Admin then names it and uploads its avatar picture.
 - + The system checks if the playlist's name already exists. If not, the playlist is generated.
 - Modify a playlist:
 - + Admin selects a playlist to view options.
 - + Admin then chooses Modify playlist to modify it. Specifically, admin can change its name, and avatar picture.
 - + The system checks if the playlist's name already exists. If not, the playlist is updated.
 - Manage songs in a playlist:
 - + Admin goes to a specific playlist to view all its songs

- + Then, admin follows the steps mentioned above in Manage song, the flow will be the same as managing song.
- When modifying/adding songs, instead of just typing the full lyrics, there's a feature to let admins upload lyrics file (including timestamps and lyrics in it).
- When modifying/adding songs and playlists, let admin upload avatar picture.

2. Use-case Manage reports:

Design UI for this use-case:

- Name: Manage report.
- This use-case describes the feature which lets admins view and take actions on users' reports. The report can be about a toxic/inappropriate song, or comment of a user.
- The basic flow in this use-case:
 - + The admin goes to the Reports section to see all reports.
 - + Reports are listed into 2 categories: *Reported Comments* and *Reported Songs*.
 - + The admin clicks Refresh to refresh reports.
 - + The system fetches the database to update the reports lists.
 - + The admin chooses 1 report to process it.
 - + The admin chooses Ignore to delete the report and take no actions, or chooses Review to process the report.
 - + The system then removes that report from the list.
- The UI must show these buttons: Refresh, Exit; and two discrete categories of reports: Reported Comments and Reported Songs.

3. Use-case Delete content:

Design UI for this use-case:

- Name: Delete content.
- This use-case describes how admins delete toxic/inappropriate comments or songs which have been reported.
- This use-case is an action in processing reports. The admin must have already gone to Manage reports section to process reports.
- The basic flow in this use-case:
 - + The admin selects a report in the reports lists and selects Review.
 - + The admin now can see its content (can be the comment or the song).
 - + The admin selects Delete content to delete the content.
 - + The system checks if the content still exists.
 - + If the content still exists, the system removes it from the platform.
 - + A message saying "The content has been deleted successfully" will be displayed.

4. Use-case Ban users:

Design UI for this use-case:

- Name: Ban users.
- This use-case describes how admins ban users due to their toxic/inappropriate comments.
- This use-case is an action in processing reports. The admin must have already gone to Manage reports section to process reports.
- The basic flow in this use-case:

- + The admin selects a report in the *comment reports list* and selects Review
- + The admin now can see the comment and the user who posted it.
- + The admin selects Ban user to ban the user who posted the comment.
- + The system checks if that user account still exists.
- + If the account still exists, the system removes that account from the platform.
- + A message will display to show that the account has been removed successfully.

Use-case Manage premium packages:

Design UI for this use-case:

- Name: Manage premium packages
- This use-case describes how admins add, remove and modify premium packages (including the price, the duration of the premium account) or edit the platform's payment receiving account.
- This use-case is an action in processing reports. The admin must have already gone to Manage reports section to process reports.
- The basic flow in this use-case:
To edit premium packages:
 1. Admin goes to the Premium packages section to view all premium packages.
 2. Admin can manage premium packages here.
 - To remove/modify package: Admin selects one package and then selects Delete or updates the price or account's duration.
 - To add a new package: Admin selects Add new package to add a package.
 3. The package is removed/added/edited.
- To change platform's payment receiving account:
 1. Admin goes to the Premium packages section.
 2. Here, change the account information at Receiving account.
 3. The system checks if the account is valid.
 4. If the account is valid, the platform's payment receiving account is updated.
- The GUI in this Premium subscriptions section contains 2 parts: The Receiving account and The Premium packages list.
 - + For the Receiving Account part, it must shows: the bank account number, the bank's name, the account holder's name. Also, there needs to be a Change Account button so that admins can change the Receiving account.
 - + The Premium Packages list part, it shows the packages' information, which includes its price and its duration. And there must be an Add New Package button for adding new packages.
- When adding/modifying a premium package, there are 2 pieces of information to type/modify: Price and Duration.

Notes:

- The tabs are shown on the left
- When we click something, makes it highlighted (maybe change color to white).
- In Manage music tabs, code the functions: Add song, Delete song, Modify song. A song has these data to add/modify: audio file, lyrics file, avatar image file, composers, artists, published year, genre.
- The playlists tab is the same, code Add playlist, Delete playlist, Modify playlist. A playlist has these data: Avatar file, songs, name.
- Also, give the playlist and songs the example data, not just "Song title 1".
- The colors don't have to be only purple and black, those are 2 main colors but you

can add some other dark colors if necessary.

Đã:

UI generated by v0.app:

- UI for browse feature:
 - Create an interface for the browse music feature for a music streaming website, with a browse button on the menu for users to select. Then a browse list appears for users to choose from, such as music, podcasts, live events, made for you, new releases,....
 - Switch to dark theme, categories for decorative patterns instead of solid colors (matching the theme), also browse should be a button, and on the category list there should be a label that says "Start exploring your music".
 - Move the account option to a separate bar, change the icon of the browse button (or maybe leave it without any icon), and make the browse button pink-purple to match the dark theme for a music streaming website, with a browse button on the menu for users to select. Then a browse list appears for users to choose from, such as music, podcasts, live events, made for you, new releases,....
 - Make a corresponding UI if users click in a category and no musics are available in the category.
- UI for play music feature:
 - I wanna create UI for music website with dark theme and (buttons maybe a bit purple). First, please follow this description:
 - System shows Home / Library / Search. User selects a song, album, or playlist from any screen.
 - System opens the content detail (title, artwork, Play button).
 - User taps "Play." System starts playback and shows the mini player (play/pause, progress, title).
 - User can Pause/Play, Skip Next / Previous, or Seek. User taps "Like" or "Add to Playlist" to save the track.
 - User can open full-screen player to view artwork, queue, and lyrics.
 - User edits the queue or changes playback modes (Shuffle / Repeat).
 - I want to set this sidebar offcanvas, and add search, browse button, account button on the menubar (at the head of the web).
 - You do very well, but now, I dont want theme and background of this web is solid black, i want a type of color match the purple color of the buttons but still remains the dark theme of a music web.
- UI for view lyrics feature:
 - Now with this UI web, can you add UI for feature view lyrics following this descriptions:
 - System displays a mini bar at the bottom of the screen when a track is playing.
 - User taps the "Lyrics" button in the player interface.
 - System checks if lyrics are available for the current track.
 - System displays the lyrics:
 - Synchronized with playback if available.
 - Static text if only plain lyrics exist.
 - User scrolls through lyrics manually if desired.
 - User can toggle full-screen or mini-player view without stopping playback.
 - User exits lyrics view by tapping a close button or navigating back.
 - Flow ends when the user leaves the lyrics view.

- You can get an example lyrics (not necessary match the playing music)
 - I want in this area, should be divided into 2 areas with border, 2 area are lyrics in the left, music in the right as they are now, remember make the color and thickness of the border modern and match with our theme.
- UI for report content feature:
 - Now, add report content feature following this description:
 - System displays the content detail page (comments, song, playlist, album, or lyrics).
 - User taps the “Report” button associated with the content.
 - System opens the report form, showing report categories or reasons (e.g., inappropriate, offensive, copyright issue).
 - User selects a reason and optionally adds a description or comment.
 - User submits the report.
 - System confirms that the report has been received, displaying a success message.
 - Flow ends when the user closes the confirmation or navigates away.

Đạt:

UI generated by gemini:

- Create the full user interface (screens, layout, key components, and main buttons/labels) for the “Upgrade to Premium” use case: [Content of flow of events in use case Upgrade to Premium]
- Actually my website has two types of users(normal user(free) and premium user). Moreover, premium users only have two additional features compared to normal users: play premium songs and create unlimited playlists. The price for monthly premium is 1\$ / month, and price for premium is 6\$ / year.
- The User can choose one of the following actions when payment fails: Retry with same payment method Select another payment method Cancel the upgrade. | you miss retry with the same payment method.
- add / edit UI for Use-Case Specification: Download songs [Content of flow of events in use case Download songs].
- add / edit UI for Use-Case Specification: Play premium songs [Content of flow of events in use case play premium songs]
- add / edit UI for Use-Case Specification: create unlimited playlists [Content of flow of events in use case create unlimited playlists]

Huy:

- Generate for me an interface Searching (Users) of website Online Music Streaming. In Searching, Users can search for songs and refine results with filters (genre, composer). (v0.dev).
- In Searching, about Semantic Search (AI feature):Users can search for songs by phrases (for example, the line “le doi ban chan buoc di tren con pho dai” is a lyric in the song “Tuyet Yeu Thuong” by Young Uno, etc,...). (v0.dev)
- The user can store the song to their personal playlist. Generate for me more about it. (v0.dev)
- Generate for me interface Sign up (Unlogged Users) of website Online Music Streaming. (v0.dev)
- If all data fields are valid, generate a success message and redirect the user to the Login Page interface. (v0.dev)
- In a login page, display an error message when login credentials are incorrect. (v0.dev)
- Implement a username field for both Sign up and Sign In interface. (v0.dev)

- Generate for me an interface Comment on Song (Users) of website Online Music Streaming. (v0.dev)
- Also, please generate a report button to report a user's comment or report an user. (v0.dev).
- Generate for me an interface Manage Playlists (Limited) / Favourite List (Users) of Online Music Streaming Website. (v0.dev).
- Users only make 5 playlists for a Free Account, and display a message to announce to users that "Update to Premium Account for more playlists". (v0.dev)
