Use-Case Specification: Manage reports

1. Use-Case Name: Manage reports

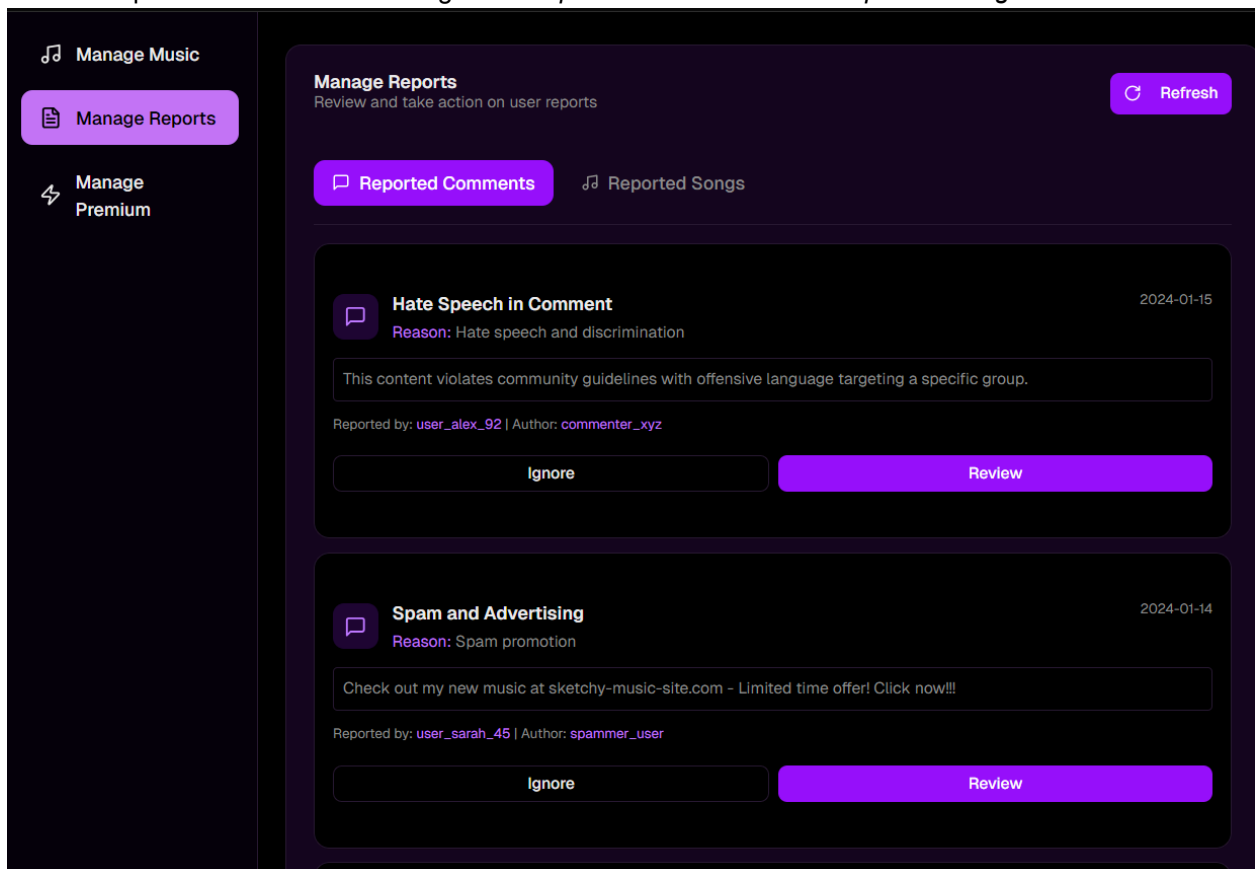

1.1 Brief Description

This use case describes the feature which lets admins view and take actions on users' reports. The report can be about a toxic/inappropriate song, or comment of a user.

2. Flow of Events

2.1 Basic Flow

1. The admin goes to the **Reports** section to see all reports.
2. Reports are listed into 2 categories: *Reported Comments* and *Reported Songs*.

3. The admin clicks **Refresh** to refresh reports.
4. The system fetches the database to update the reports lists.
5. The admin chooses 1 report to process it.
6. The admin chooses **Ignore** to delete the report and take no actions.
7. The system then removes that report from the list.

2.2 Alternative Flows

2.2.1 The report has been processed.

This alternative flow may occur at step 7 above, when another admin has treated the report making it be already removed, while the current admin has not **refreshed** the reports list to see the update.

Melody Dive	Version: 1.0
Use-Case Specification: Manage reports	Date: 06/12/2025
UC Manage reports	

In this flow, a message saying “The report has already been processed” will appear.

3. **Special Requirements**

(No special requirements)

4. **Preconditions**

4.1 **Admin account logged in**

The admin must have logged in an **Admin** account.

5. **Postconditions**

5.1 **The reports list is updated.**

After refreshing, the reports are updated.

5.2 **The report is removed.**

After ignoring a report, it is removed from the reports list.

In case it is already removed before, a message displays.

6. **Extension Points**

6.1 **Process the report**

This extension point is at step 6 in the main flow, when the admin chooses to process the report instead of just ignoring it.

The actions that the admin can take is to **Ban the user** or **Delete the reported content**, which are the 2 extended use-cases of this use-case.
