Use-Case Specification: Browse Music

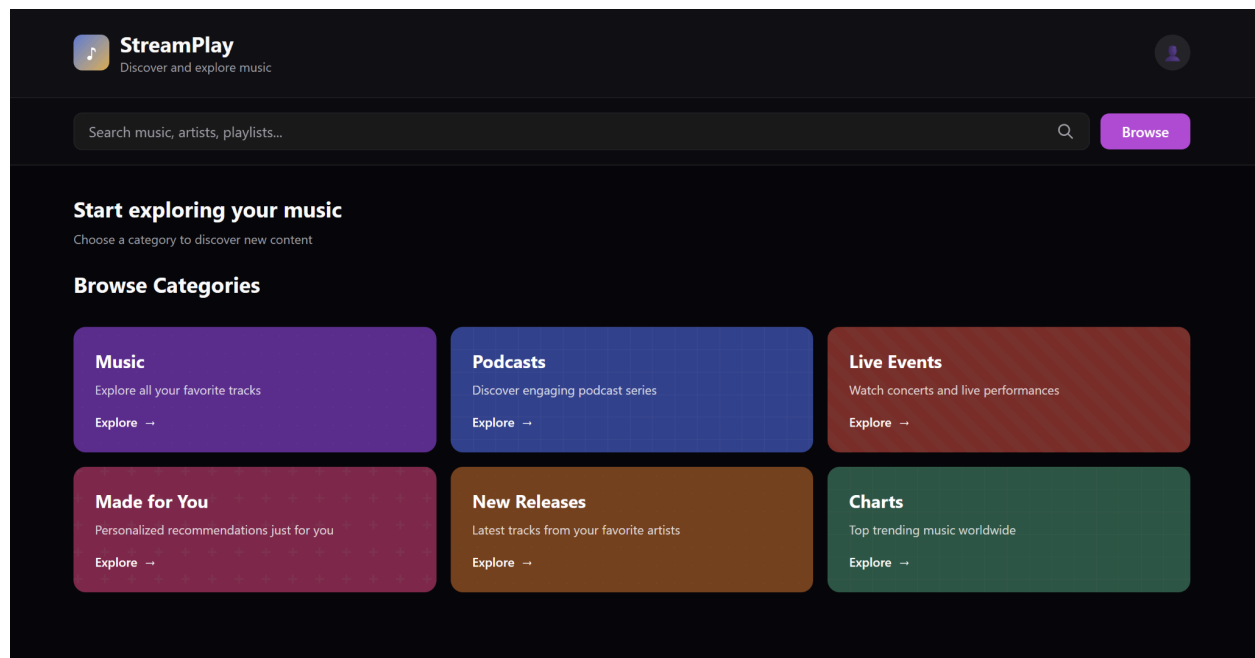

1. Use-Case Name: Browse Music

1.1 Brief Description

The purpose of the "browse music" feature is to help users explore and discover songs easily. It allows people to search by genre, mood, artist, or popularity, making it simple to find music that fits their taste. Users can listen to previews, save favorites, and enjoy new tracks anytime.

2. Flow of Events

2.1 Basic Flow

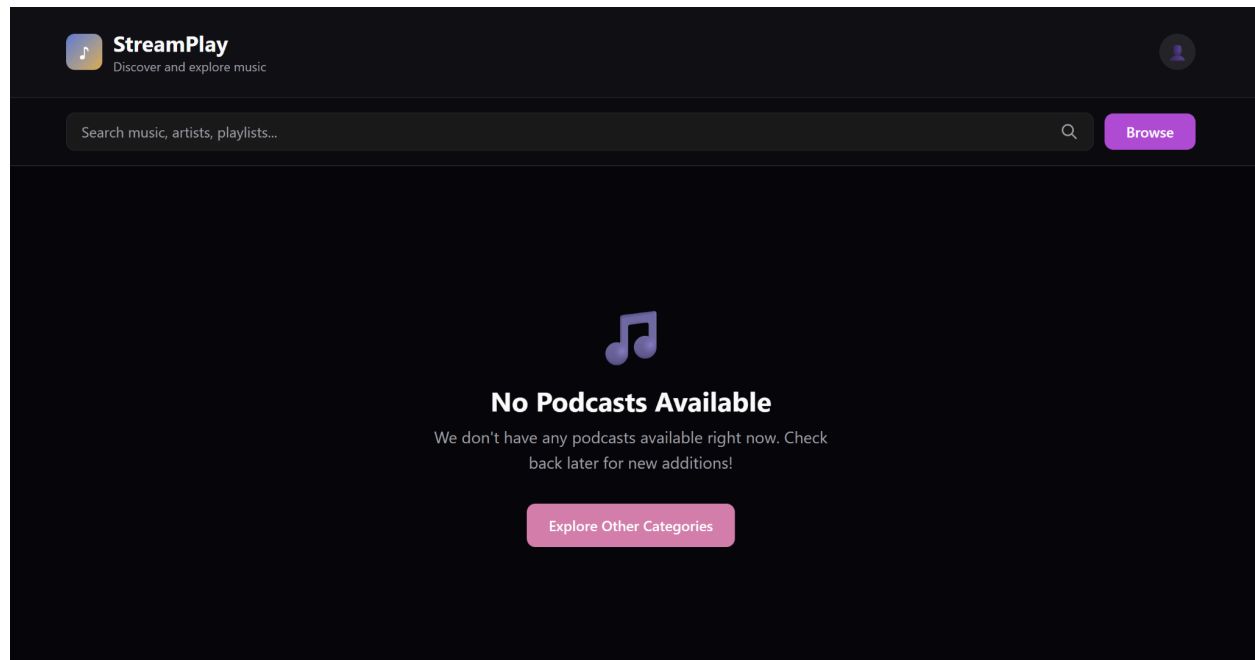

1. System displays the main menu with a "Browse" option.
2. User selects "Browse".
3. System shows categories (e.g., genre, mood, artist, popularity).
4. User chooses a category to explore.
5. System lists available songs or playlists under that category.
6. User scrolls through the list and selects a song.
7. System plays a preview or full track, depending on settings.
8. User can save the song to favorites or add it to a playlist.
9. Flow ends when the user exits browsing or continues with another category.

2.2 Alternative Flows

2.2.1 *No songs are available in the chosen category.*

- After step 4, if there is no any song in the category at the moment, the system just displays an announcement.
- There is an option button which will redirect the users to the Browse page if they click on it.

2.2.2 *User cancels browsing before selecting a song.*

- If users decide to back to home page instead of selecting a song at step 6, they will be redirected to the home page and nothing happens.

3. Special Requirements

3.1 Browse Interface Accessibility

- The interface for the “Browse” feature must be easy to locate, especially on small devices such as mobile phones. It should be positioned close to the search function to ensure quick access.

3.2 Category Display Management

- The system should display a limited number of categories at one time (e.g., 8–10 categories per view) to maintain clarity and performance. Additional categories must be accessible through smooth scrolling or “load more” functionality.

4. Preconditions

4.1 User Authenticated

The user must be logged into the application first.

4.2 Content Prepared

Each category must contain valid song entries with metadata (title, artist, cover image,...) and categories must exist in the database.

5. Postconditions

5.1 Browsing Context Mantained

The system records the user's last selected category and any songs previewed, so the user can return later without losing context.

5.2 User Preferences Updated

The system updates dynamic sections such as Made for You (or similar personalized categories) based on the user's browsing and preview activity.
